Systems

Global Reference Frame

- We saw that the matrix \mathbf{H} has not full rank (after adding the constraints)
- The global frame had not been fixed

Chap. 15: What Went Wrong?

- The constraint specifies a **relative constraint** between both nodes
- Any poses for the nodes would be fine as long as their relative coordinates fit
- **One node needs to be fixed**

$$\mathbf{H} = \begin{pmatrix} 2 & -2 \\ -2 & 2 \end{pmatrix} + \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix}$$

$$\Delta \mathbf{x} = -\mathbf{H}^{-1} b_{12}$$

$$\Delta \mathbf{x} = (0 \ 1)^T$$

constraint
that sets
 $dx_1 = 0$

**Chap. 15
error**

Role of the Prior

- Fixing the global reference frame is strongly related to the prior $p(\mathbf{x}_0)$
- A Gaussian estimate about \mathbf{x}_0 results in an additional constraint
- E.g., first pose in the origin:

$$e(\mathbf{x}_0) = t2v(\mathbf{X}_0)$$

Fixing a Subset of Variables

- Assume that the value of certain variables during the optimization is known a priori
- We may want to optimize all others and keep these fixed
- How?

Fixing a Subset of Variables

- Assume that the value of certain variables during the optimization is known a priori
- We may want to optimize all others and keep these fixed
- How?
- If a variable is not optimized, it should “disappear” from the linear system

Fixing a Subset of Variables

- Assume that the value of certain variables during the optimization is known a priori
- We may want to optimize all others and keep these fixed
- How?
- If a variable is not optimized, it should “disappear” from the linear system
- Construct the full system
- Suppress the rows and the columns corresponding to the variables to fix

Uncertainty

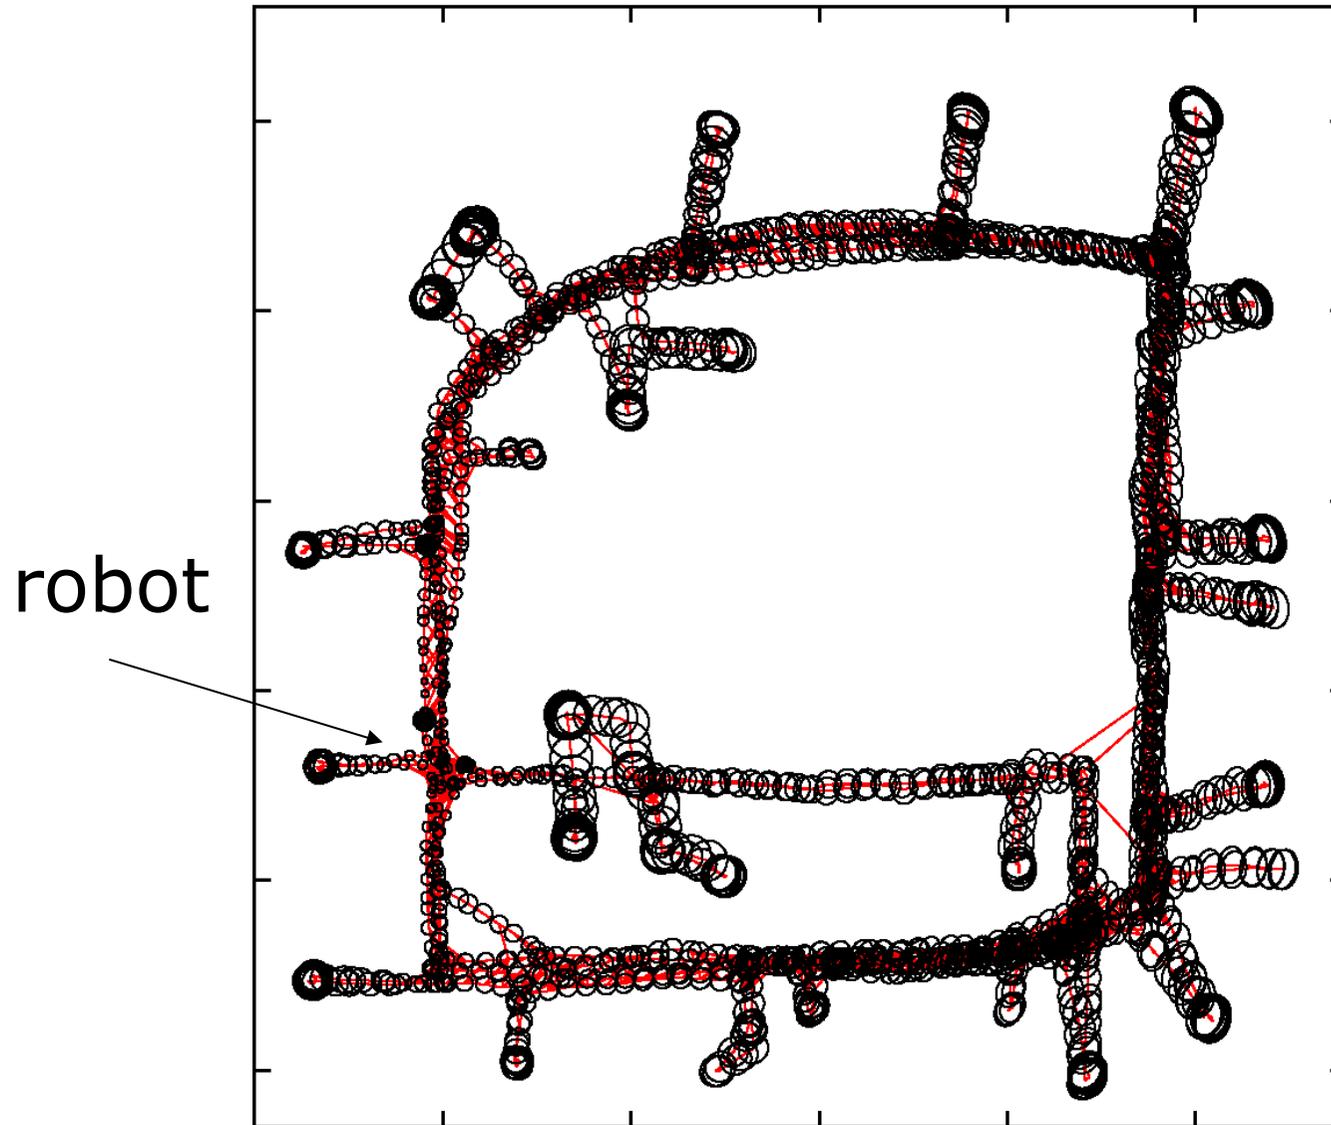

- \mathbf{H} represents the information matrix given the linearization point
- Inverting \mathbf{H} gives the covariance matrix (which is dense)
- The diagonal blocks of the covariance matrix represent the (absolute) uncertainties of the corresponding variables

Relative Uncertainty

To determine the relative uncertainty between x_i and x_j :

- Construct the full matrix \mathbf{H}
- Suppress the rows and the columns of x_i (=fix it)
- Compute the j,j block of the inverse
- This block will contain the covariance matrix of x_j w.r.t. x_i , which has been fixed

Example

Summary

- Prior knowledge about a pose results in an additional constraint
- Embedding prior knowledge about the position of some parts of the map
- Computing the relative uncertainties
