# Introduction to Mobile Robotics

# **Probabilistic Motion Models**

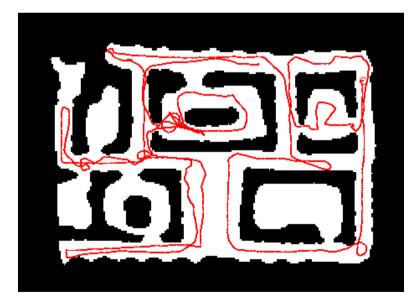

Wolfram Burgard, Cyrill Stachniss,

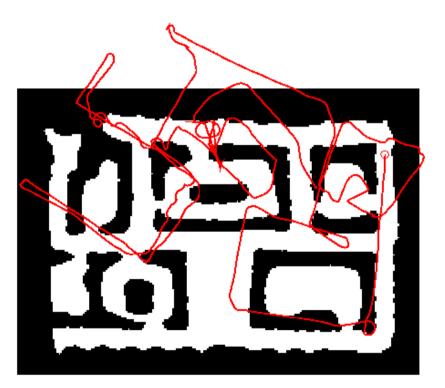

Maren Bennewitz, Kai Arras

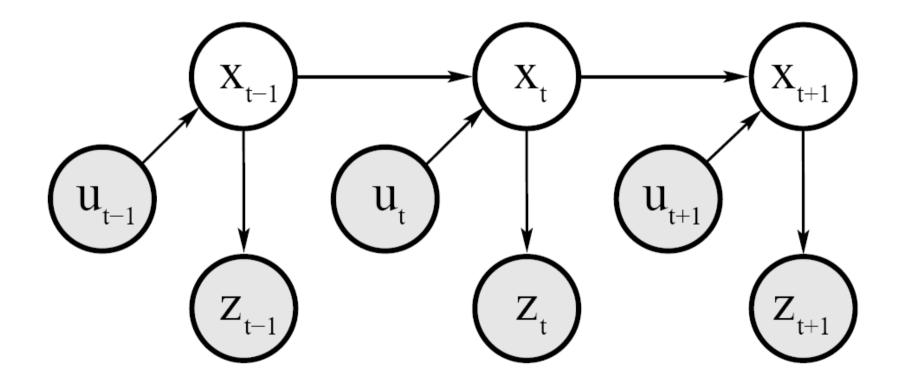

### **Robot Motion**

- Robot motion is inherently uncertain.
- How can we model this uncertainty?

### **Dynamic Bayesian Network for Controls, States, and Sensations**

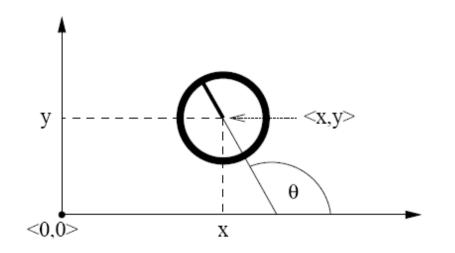

# **Probabilistic Motion Models**

- To implement the Bayes Filter, we need the transition model p(x j x', u).
- The term p(x j x', u) specifies a posterior probability, that action u carries the robot from x' to x.
- In this section we will specify, how *p(x j x', u)* can be modeled based on the motion equations.

# **Coordinate Systems**

- In general the configuration of a robot can be described by six parameters.
- Three-dimensional Cartesian coordinates plus three Euler angles pitch, roll, and tilt.
- Throughout this section, we consider robots operating on a planar surface.
- The state space of such systems is threedimensional (x,y,θ).

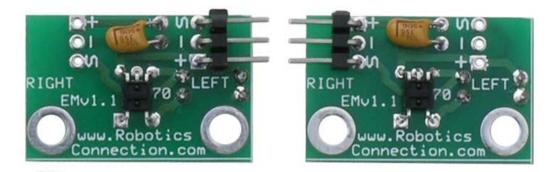

# **Typical Motion Models**

- In practice, one often finds two types of motion models:
  - Odometry-based
  - Velocity-based (dead reckoning)
- Odometry-based models are used when systems are equipped with wheel encoders.
- Velocity-based models have to be applied when no wheel encoders are given.
- They calculate the new pose based on the velocities and the time elapsed.

# **Example Wheel Encoders**

These modules require +5V and GND to power them, and provide a 0 to 5V output. They provide +5V output when they "see" white, and a 0V output when they "see" black.

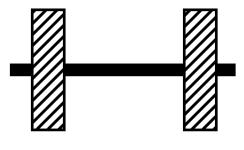

These disks are manufactured out of high quality laminated color plastic to offer a very crisp black to white transition. This enables a wheel encoder sensor to easily see the transitions.

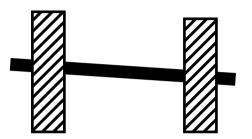

# **Dead Reckoning**

- Derived from "deduced reckoning."
- Mathematical procedure for determining the present location of a vehicle.
- Achieved by calculating the current pose of the vehicle based on its velocities and the time elapsed.

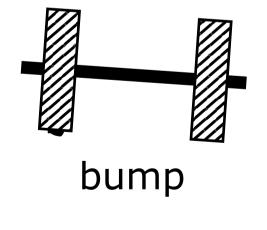

### **Reasons for Motion Errors**

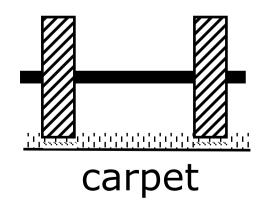

ideal case

different wheel diameters

and many more ...

### **Odometry Model**

- Robot moves from  $\langle \bar{x}, \bar{y}, \bar{\theta} \rangle$  to  $\langle \bar{x}', \bar{y}', \bar{\theta}' \rangle$ .
- Odometry information  $u = \langle \delta_{rot1}, \delta_{rot2}, \delta_{trans} \rangle$ .

$$\delta_{trans} = \sqrt{(\bar{x}' - \bar{x})^2 + (\bar{y}' - \bar{y})^2}$$
  

$$\delta_{rot1} = \operatorname{atan2}(\bar{y}' - \bar{y}, \bar{x}' - \bar{x}) - \bar{\theta}$$
  

$$\delta_{rot2} = \bar{\theta}' - \bar{\theta} - \delta_{rot1}$$
  

$$\delta_{rot2}$$
  

$$\delta_{rot2}$$

# **The atan2 Function**

 Extends the inverse tangent and correctly copes with the signs of x and y.

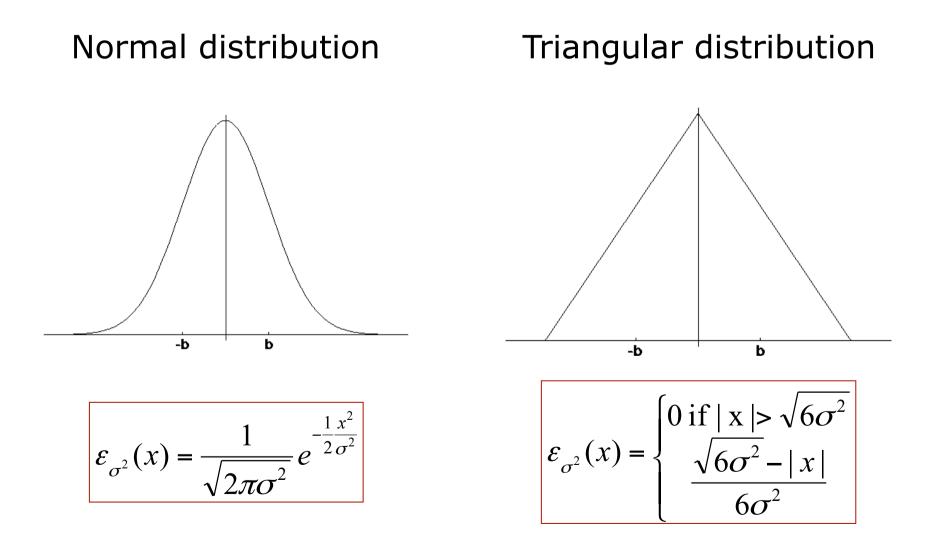

$$\operatorname{atan}(y,x) = \begin{cases} \operatorname{atan}(y/x) & \text{if } x > 0\\ \operatorname{sign}(y) (\pi - \operatorname{atan}(|y/x|)) & \text{if } x < 0\\ 0 & \text{if } x = y = 0\\ \operatorname{sign}(y) \pi/2 & \text{if } x = 0, y \neq 0 \end{cases}$$

### **Noise Model for Odometry**

 The measured motion is given by the true motion corrupted with noise.

$$\hat{\delta}_{rot1} = \delta_{rot1} + \varepsilon_{\alpha_1 |\delta_{rot1}| + \alpha_2 |\delta_{trans}|}$$
$$\hat{\delta}_{trans} = \delta_{trans} + \varepsilon_{\alpha_3 |\delta_{trans}| + \alpha_4 |\delta_{rot1} + \delta_{rot2}|}$$
$$\hat{\delta}_{rot2} = \delta_{rot2} + \varepsilon_{\alpha_1 |\delta_{rot2}| + \alpha_2 |\delta_{trans}|}$$

# **Typical Distributions for Probabilistic Motion Models**

# **Calculating the Probability** (zero-centered)

- For a normal distribution
  - 1. Algorithm **prob\_normal\_distribution**(*a*,*b*):

2. return 
$$\frac{1}{\sqrt{2\pi b^2}} \exp\left\{-\frac{1}{2}\frac{a^2}{b^2}\right\}$$

For a triangular distribution

1. Algorithm **prob\_triangular\_distribution**(*a*,*b*):

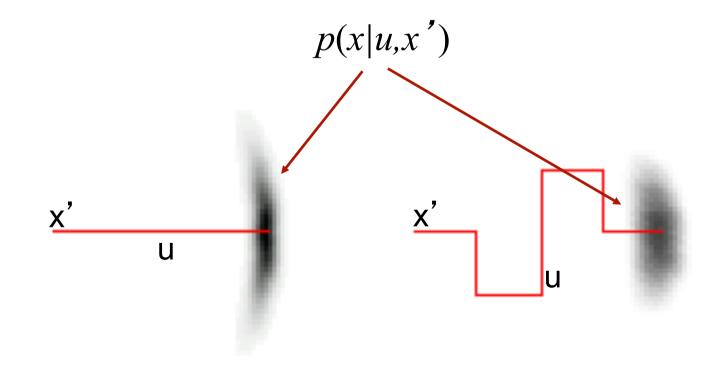

**2.** return 
$$\max\left\{0, \frac{1}{\sqrt{6} b} - \frac{|a|}{6 b^2}\right\}$$

# Calculating the Posterior Given x, x', and u

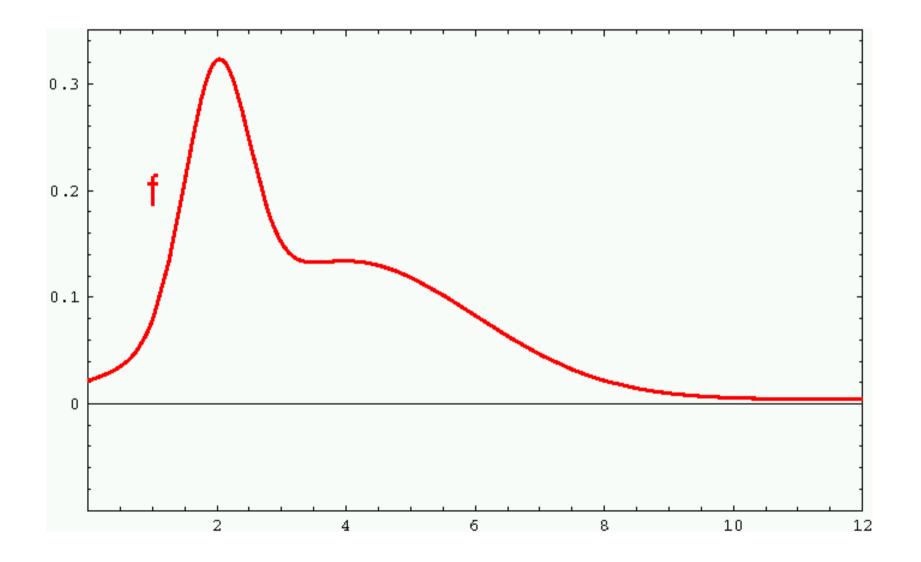

Algorithm **motion\_model\_odometry(x,x',u)** 1. 2.  $\delta_{trans} = \sqrt{(\bar{x}' - \bar{x})^2 + (\bar{y}' - \bar{y})^2}$ 3.  $\delta_{rot1} = \operatorname{atan2}(\bar{y}' - \bar{y}, \bar{x}' - \bar{x}) - \bar{\theta}$   $\longrightarrow$  odometry values (u) 4.  $\delta_{rot^2} = \theta' - \theta - \delta_{rot^1}$ 5.  $\hat{\delta}_{trans} = \sqrt{(x'-x)^2 + (y'-y)^2}$ 6.  $\hat{\delta}_{rot1} = \operatorname{atan2}(y'-y, x'-x) - \overline{\theta}$  values of interest (x,x') 7.  $\hat{\delta}_{rot} = \theta' - \theta - \hat{\delta}_{rot}$ 8.  $p_1 = \operatorname{prob}(\delta_{\operatorname{rot1}} - \hat{\delta}_{\operatorname{rot1}}, \alpha_1 | \hat{\delta}_{\operatorname{rot1}} | + \alpha_2 \hat{\delta}_{\operatorname{trans}})$ 9.  $p_2 = \operatorname{prob}(\delta_{\operatorname{trans}} - \hat{\delta}_{\operatorname{trans}}, \alpha_3 \hat{\delta}_{\operatorname{trans}} + \alpha_4 (| \hat{\delta}_{\operatorname{rot1}} | + | \hat{\delta}_{\operatorname{rot2}} |))$ 10.  $p_3 = \operatorname{prob}(\delta_{rot2} - \hat{\delta}_{rot2}, \alpha_1 | \hat{\delta}_{rot2} | + \alpha_2 \hat{\delta}_{trans})$ 11. return  $p_1 \cdot p_2 \cdot p_3$ 

# **Application**

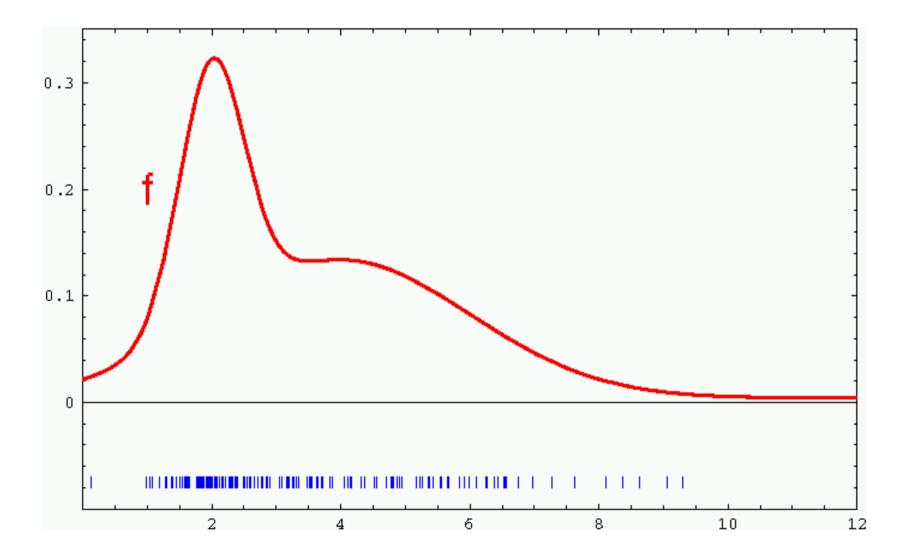

- Repeated application of the sensor model for short movements.
- Typical banana-shaped distributions obtained for 2d-projection of 3d posterior.

#### **Sample-based Density Representation**

#### **Sample-based Density Representation**

18

# How to Sample from Normal or Triangular Distributions?

- Sampling from a normal distribution
  - 1. Algorithm **sample\_normal\_distribution**(*b*):

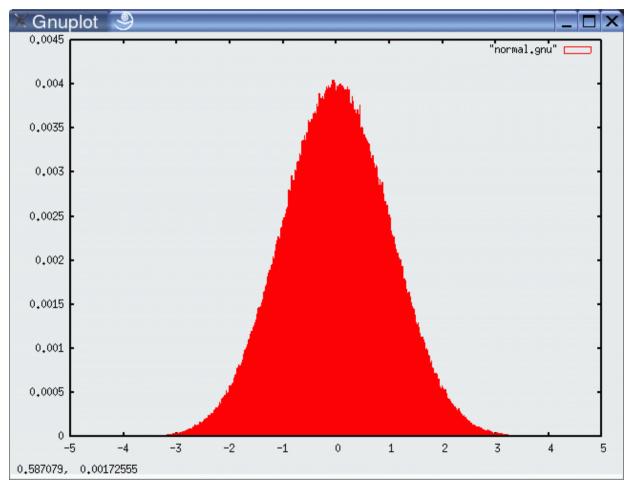

2. return 
$$\frac{1}{2} \sum_{i=1}^{12} rand(-b, b)$$

Sampling from a triangular distribution

1. Algorithm **sample\_triangular\_distribution**(*b*):

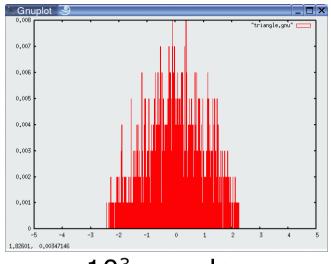

2. return 
$$\frac{\sqrt{6}}{2}$$
 [rand $(-b,b)$  + rand $(-b,b)$ ]

# **Normally Distributed Samples**

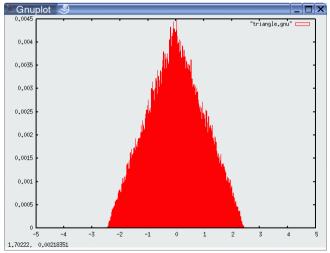

10<sup>6</sup> samples

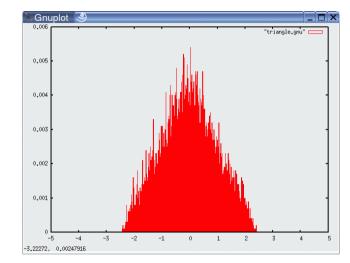

# **For Triangular Distribution**

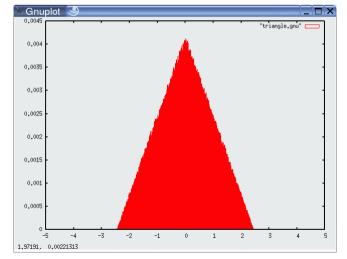

10<sup>3</sup> samples

10<sup>4</sup> samples

# **Rejection Sampling**

- Sampling from arbitrary distributions
  - 1. Algorithm **sample\_distribution**(*f*,*b*):
  - 2. repeat

3. 
$$x = \operatorname{rand}(-b, b)$$

4.  $y = rand(0, max\{f(x) \mid x \in (-b, b)\})$ 

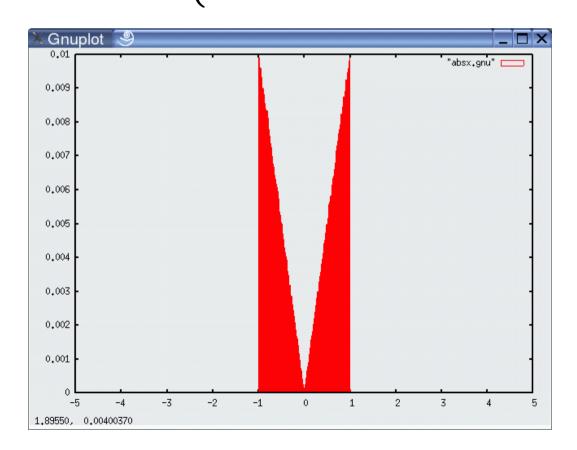

5. until 
$$(y \leq f(x))$$

6. return x

### Example

#### Sampling from

$$f(x) = \begin{cases} abs(x) & x \in [-1; 1] \\ 0 & otherwise \end{cases}$$

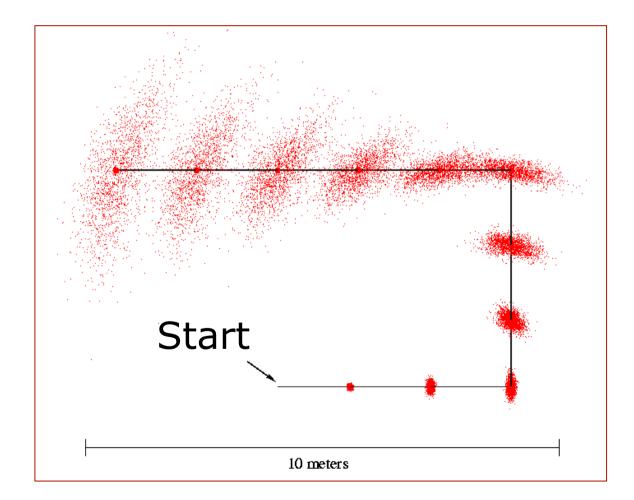

### **Sample Odometry Motion Model**

1. Algorithm **sample\_motion\_model**(u, x):

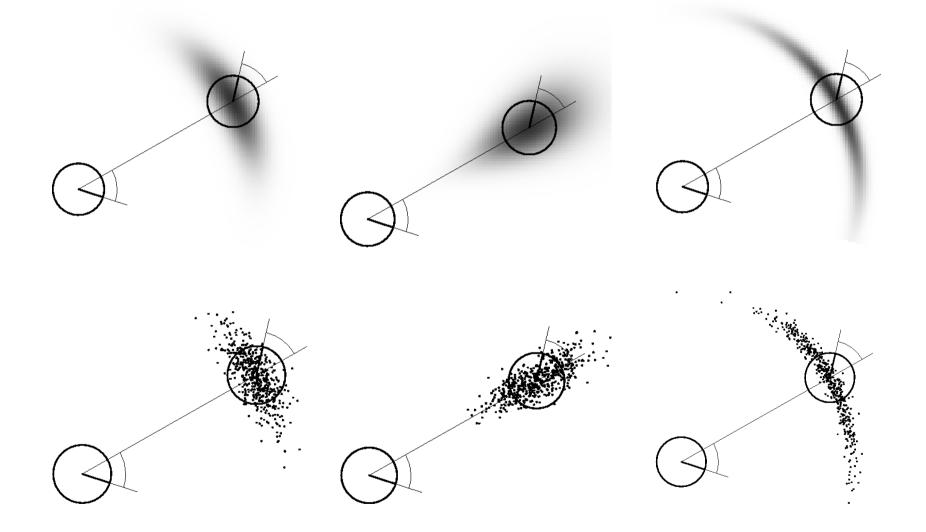

$$u = \langle \delta_{rot1}, \delta_{rot2}, \delta_{trans} \rangle, x = \langle x, y, \theta \rangle$$
1.  $\hat{\delta}_{rot1} = \delta_{rot1} + \text{sample}(\alpha_1 | \delta_{rot1} | + \alpha_2 \delta_{trans})$ 
2.  $\hat{\delta}_{trans} = \delta_{trans} + \text{sample}(\alpha_3 \delta_{trans} + \alpha_4 (| \delta_{rot1} | + | \delta_{rot2} |))$ 
3.  $\hat{\delta}_{rot2} = \delta_{rot2} + \text{sample}(\alpha_1 | \delta_{rot2} | + \alpha_2 \delta_{trans})$ 
4.  $x' = x + \hat{\delta}_{trans} \cos(\theta + \hat{\delta}_{rot1})$ 
5.  $y' = y + \hat{\delta}_{trans} \sin(\theta + \hat{\delta}_{rot1})$ 
5.  $\theta' = \theta + \hat{\delta}_{rot1} + \hat{\delta}_{rot2}$ 

7. Return  $\langle x', y', \theta' \rangle$ 

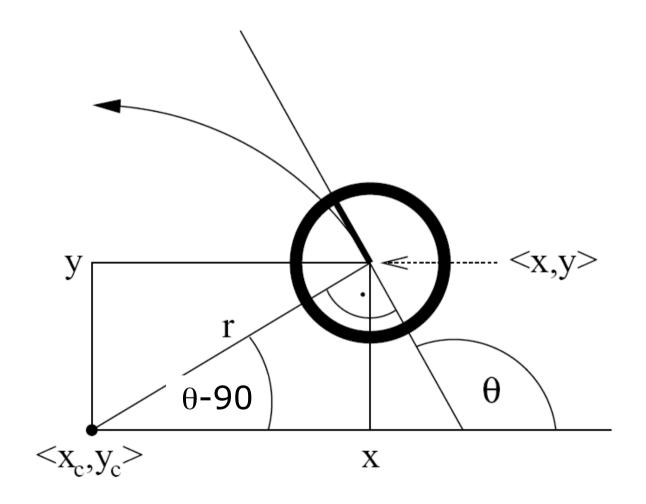

# Sampling from Our Motion Model

### **Examples (Odometry-Based)**

### **Velocity-Based Model**

27

### **Equation for the Velocity Model**

Center of circle:

$$\begin{pmatrix} x^* \\ y^* \end{pmatrix} = \begin{pmatrix} x \\ y \end{pmatrix} + \begin{pmatrix} -\lambda \sin \theta \\ \lambda \cos \theta \end{pmatrix} = \begin{pmatrix} \frac{x+x'}{2} + \mu(y-y') \\ \frac{y+y'}{2} + \mu(x'-x) \end{pmatrix}$$
  
with  
$$\mu = \frac{1}{2} \frac{(x-x')\cos\theta + (y-y')\sin\theta}{(y-y')\cos\theta - (x-x')\sin\theta}$$

# **Posterior Probability for Velocity Model**

1: **Algorithm motion\_model\_velocity**( $x_t, u_t, x_{t-1}$ ):

2: 
$$\mu = \frac{1}{2} \frac{(x - x')\cos\theta + (y - y')\sin\theta}{(y - y')\cos\theta - (x - x')\sin\theta}$$
$$x + x'$$

3: 
$$x^* = \frac{x+x}{2} + \mu(y-y')$$

4: 
$$y^* = \frac{y + y'}{2} + \mu(x' - x)$$

5: 
$$r^* = \sqrt{(x - x^*)^2 + (y - y^*)^2}$$

6: 
$$\Delta \theta = \operatorname{atan2}(y' - y^*, x' - x^*) - \operatorname{atan2}(y - y^*, x - x^*)$$

7: 
$$\hat{v} = \frac{\Delta \theta}{\Delta t} r^*$$

8: 
$$\hat{\omega} = \frac{\Delta\theta}{\Delta t}$$

9: 
$$\hat{\gamma} = \frac{\theta' - \theta}{\Delta t} - \hat{\omega}$$

10: 
$$return \operatorname{prob}(v - \hat{v}, \alpha_1 |v| + \alpha_2 |\omega|) \cdot \operatorname{prob}(\omega - \hat{\omega}, \alpha_3 |v| + \alpha_4 |\omega|)$$
  
  $\cdot \operatorname{prob}(\hat{\gamma}, \alpha_5 |v| + \alpha_6 |\omega|)$  29

# **Sampling from Velocity Model**

- 1: **Algorithm sample\_motion\_model\_velocity(** $u_t$ ,  $x_{t-1}$ **):**
- 2:  $\hat{v} = v + \mathbf{sample}(\alpha_1 |v| + \alpha_2 |\omega|)$

3: 
$$\hat{\omega} = \omega + \operatorname{sample}(\alpha_3 |v| + \alpha_4 |\omega|)$$

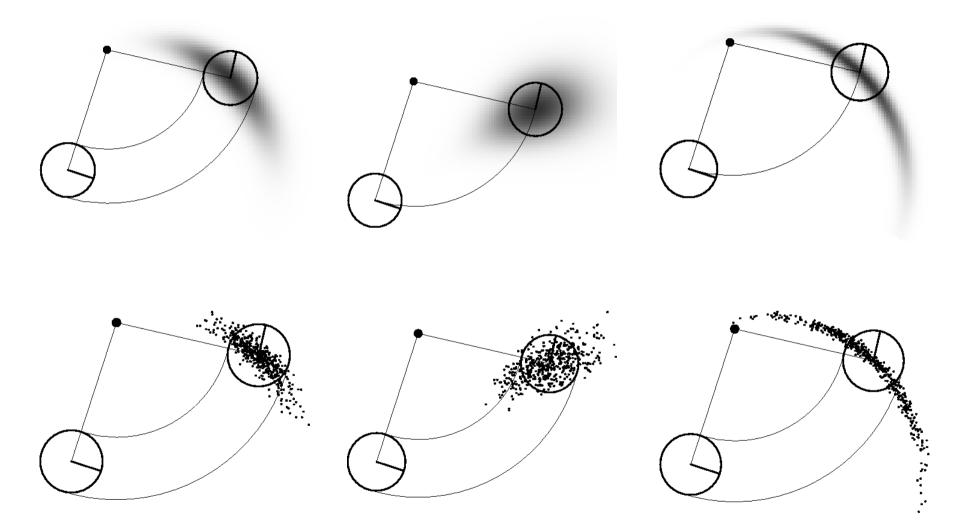

- 4:  $\hat{\gamma} = \mathbf{sample}(\alpha_5 |v| + \alpha_6 |\omega|)$
- 5:  $x' = x \frac{\hat{v}}{\hat{\omega}}\sin\theta + \frac{\hat{v}}{\hat{\omega}}\sin(\theta + \hat{\omega}\Delta t)$

6: 
$$y' = y + \frac{\hat{v}}{\hat{\omega}} \cos \theta - \frac{\hat{v}}{\hat{\omega}} \cos(\theta + \hat{\omega}\Delta t)$$

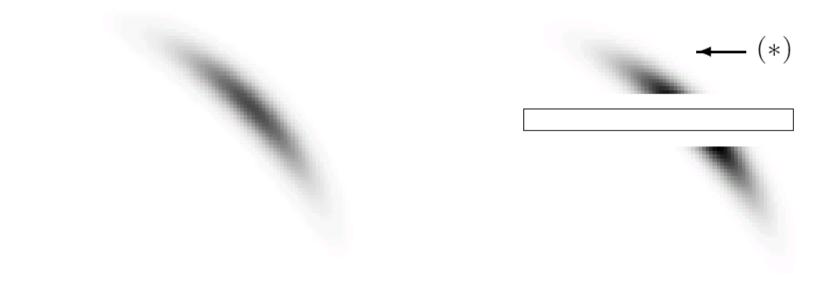

7: 
$$\theta' = \theta + \hat{\omega}\Delta t + \hat{\gamma}\Delta t$$

8: return 
$$x_t = (x', y', \theta')^T$$

### **Examples (velocity based)**

#### **Map-Consistent Motion Model**

Approximation:  $p(x | u, x', m) = \eta p(x | m) p(x | u, x')$ 

# Summary

- We discussed motion models for odometry-based and velocity-based systems
- We discussed ways to calculate the posterior probability p(x | x', u).
- We also described how to sample from p(x|x', u).
- Typically the calculations are done in fixed time intervals  $\Delta t$ .
- In practice, the parameters of the models have to be learned.
- We also discussed an extended motion model that takes the map into account.
