# **Bayes Filter Reminder**

$$Bel(x_t) = \eta P(z_t | x_t) \int P(x_t | u_t, x_{t-1}) Bel(x_{t-1}) dx_{t-1}$$

- 1. Algorithm **Bayes\_filter**(*Bel(x),d*):
- **2.** η=0
- 3. If *d* is a perceptual data item *z* then
- 4. For all x do
- 5.  $Bel'(x) = P(z \mid x)Bel(x)$

$$\theta. \qquad \eta = \eta + Bel'(x)$$

7. For all *x* do

8. 
$$Bel'(x) = \eta^{-1}Bel'(x)$$

- 9. Else if *d* is an action data item *u* then
- 10. For all x do

11. 
$$Bel'(x) = \int P(x | u, x') Bel(x') dx'$$

12. Return Bel'(x)

# **Kalman Filter**

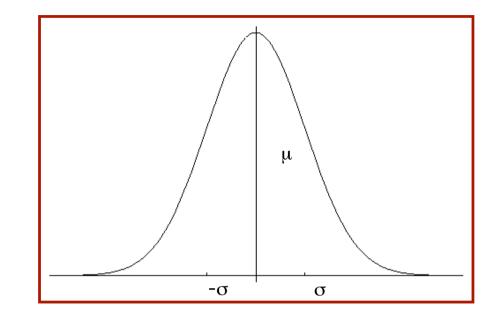

- Bayes filter with Gaussians
- Developed in the late 1950's
- Most relevant Bayes filter variant in practice
- Applications range from economics, wheather forecasting, satellite navigation to robotics and many more.
- The Kalman filter "algorithm" is a couple of matrix multiplications!

### Gaussians

$$p(x) \sim N(\mu, \sigma^2):$$

$$p(x) = \frac{1}{\sqrt{2\pi\sigma}} e^{-\frac{1}{2}\frac{(x-\mu)^2}{\sigma^2}}$$

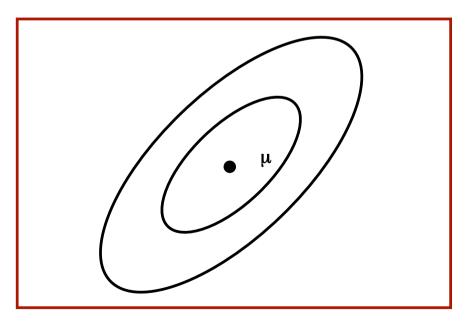

Univariate

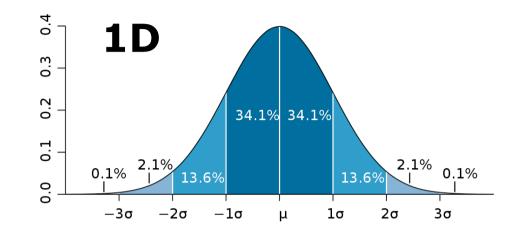

$$p(\mathbf{x}) \sim N(\boldsymbol{\mu}, \boldsymbol{\Sigma}):$$

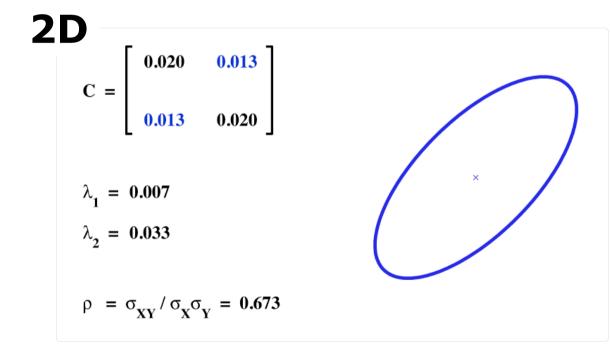

$$p(\mathbf{x}) = \frac{1}{(2\pi)^{d/2} |\boldsymbol{\Sigma}|^{1/2}} e^{-\frac{1}{2}(\mathbf{x}-\boldsymbol{\mu})^t \boldsymbol{\Sigma}^{-1}(\mathbf{x}-\boldsymbol{\mu})}$$

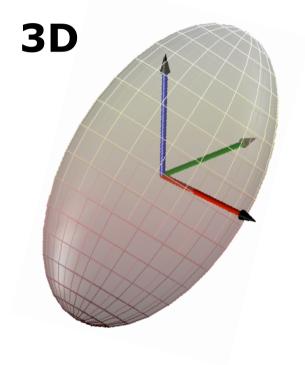

Multivariate

### Gaussians

## **Properties of Gaussians**

Univariate case

$$\left. \begin{array}{l} X \sim N(\mu, \sigma^2) \\ Y = aX + b \end{array} \right\} \quad \Rightarrow \quad Y \sim N(a\mu + b, a^2 \sigma^2)$$

$$X_{1} \sim N(\mu_{1}, \sigma_{1}^{2}) \\ X_{2} \sim N(\mu_{2}, \sigma_{2}^{2}) \} \Rightarrow p(X_{1}) \cdot p(X_{2}) \sim N\left(\frac{\sigma_{2}^{2}}{\sigma_{1}^{2} + \sigma_{2}^{2}}\mu_{1} + \frac{\sigma_{1}^{2}}{\sigma_{1}^{2} + \sigma_{2}^{2}}\mu_{2}, \frac{1}{\sigma_{1}^{-2} + \sigma_{2}^{-2}}\right)$$

# **Properties of Gaussians**

Multivariate case

$$\left. \begin{array}{c} X \sim N(\mu, \Sigma) \\ Y = AX + B \end{array} \right\} \quad \Rightarrow \quad Y \sim N(A\mu + B, A\Sigma A^T)$$

$$X_{1} \sim N(\mu_{1}, \Sigma_{1}) \\ X_{2} \sim N(\mu_{2}, \Sigma_{2}) \} \Rightarrow p(X_{1}) \cdot p(X_{2}) \sim N\left(\frac{\Sigma_{2}}{\Sigma_{1} + \Sigma_{2}}\mu_{1} + \frac{\Sigma_{1}}{\Sigma_{1} + \Sigma_{2}}\mu_{2}, \frac{1}{\Sigma_{1}^{-1} + \Sigma_{2}^{-1}}\right)$$

(where division "-" denotes matrix inversion)

 We stay Gaussian as long as we start with Gaussians and perform only linear transformations

### **Discrete Kalman Filter**

Estimates the state *x* of a discrete-time controlled process that is governed by the linear stochastic difference equation

$$x_t = A_t x_{t-1} + B_t u_t + \varepsilon_t$$

with a measurement

$$z_t = C_t x_t + \delta_t$$

# **Components of a Kalman Filter**

$A_t$
-------

Matrix (nxn) that describes how the state evolves from *t* to *t*-1 without controls or noise.

Matrix (nxl) that describes how the control  $u_t$  changes the state from t to t-1.

Matrix (kxn) that describes how to map the state  $x_t$  to an observation  $z_t$ .

 $\delta_t$ 

Random variables representing the process and measurement noise that are assumed to be independent and normally distributed with covariance  $Q_t$  and  $R_t$  respectively.

### **Bayes Filter Reminder**

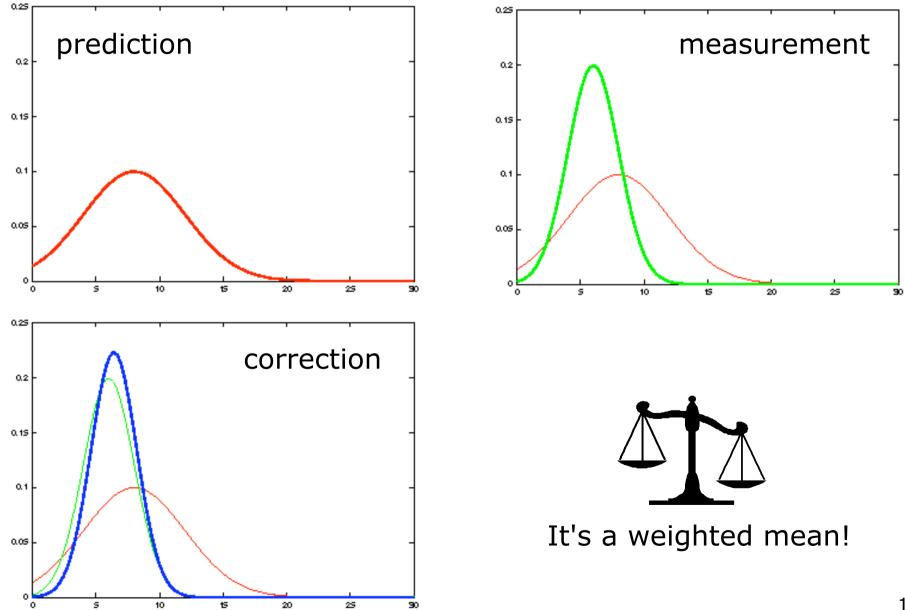

Prediction

$$\overline{bel}(x_t) = \int p(x_t | u_t, x_{t-1}) bel(x_{t-1}) dx_{t-1}$$

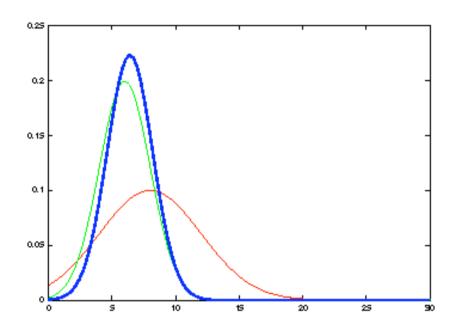

Correction

$$bel(x_t) = \eta p(z_t \mid x_t) bel(x_t)$$

### **Kalman Filter Updates**

#### **Linear Gaussian Systems: Initialization**

Initial belief is normally distributed:

$$bel(x_0) = N(x_0; \mu_0, \Sigma_0)$$

#### **Linear Gaussian Systems: Dynamics**

 Dynamics are linear function of state and control plus additive noise:

$$x_t = A_t x_{t-1} + B_t u_t + \varepsilon_t$$

$$p(x_t | u_t, x_{t-1}) = N(x_t; A_t x_{t-1} + B_t u_t, Q_t)$$

#### **Linear Gaussian Systems: Dynamics**

#### **Linear Gaussian Systems: Observations**

 Observations are linear function of state plus additive noise:

$$z_t = C_t x_t + \delta_t$$

$$p(z_t \mid x_t) = N(z_t; C_t x_t, R_t)$$

# **Kalman Filter Summary**

 Highly efficient: Polynomial in the measurement dimensionality k and state dimensionality n:

 $O(k^{2.376} + n^2)$ 

- Optimal for linear Gaussian systems!
- Most robotics systems are **nonlinear**!

# **Nonlinear Dynamic Systems**

 Most realistic robotic problems involve nonlinear functions

$$x_t = g(u_t, x_{t-1})$$

$$z_t = h(x_t)$$

# **EKF Linearization: First Order Taylor Series Expansion**

Prediction:

 $g(u_t, x_{t-1}) \approx g(u_t, \mu_{t-1}) + \frac{\partial g(u_t, \mu_{t-1})}{\partial x_{t-1}} (x_{t-1} - \mu_{t-1})$  $g(u_t, x_{t-1}) \approx g(u_t, \mu_{t-1}) + G_t (x_{t-1} - \mu_{t-1})$ 

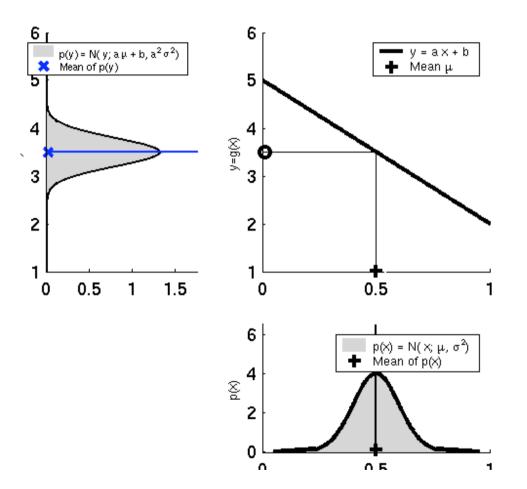

Correction:

$$h(x_t) \approx h(\overline{\mu}_t) + \frac{\partial h(\overline{\mu}_t)}{\partial x_t} (x_t - \overline{\mu}_t)$$
$$h(x_t) \approx h(\overline{\mu}_t) + H_t (x_t - \overline{\mu}_t)$$
