Introduction to Mobile Robotics

Robot Control Paradigms

Wolfram Burgard, Cyrill Stachniss, Maren Bennewitz, Diego Tipaldi, Luciano Spinello
Classical / Hierarchical Paradigm

- 70’s
- Focus on automated reasoning and knowledge representation
- STRIPS (Stanford Research Institute Problem Solver): Perfect world model, closed world assumption
- Find boxes and move them to designated position
Stanford CART ‘73

Stanford AI Laboratory / CMU (Moravec)
Classical Paradigm
Stanford Cart

1. Take nine images of the environment, identify interesting points in one image, and use other images to obtain depth estimates.

2. Integrate information into global world model.

3. Correlate images with previous image set to estimate robot motion.

4. On basis of desired motion, estimated motion, and current estimate of environment, determine direction in which to move.

5. Execute the motion.
Classical Paradigm as Horizontal/Functional Decomposition
Reactive / Behavior-based Paradigm

- No models: The world is its own, best model
- Easy successes, but also limitations
- Investigate biological systems
Reactive Paradigm as Vertical Decomposition

- Sensing
- Environment
- Action

- ...}
- Explore
- Wander
- Avoid obstacles
Characteristics of Reactive Paradigm

- **Situated** agent, robot is integral part of the world.
- **No memory**, controlled by what is happening in the world.
- **Tight coupling** between perception and action via behaviors.
- Only local, behavior-specific sensing is permitted (**ego-centric** representation).
Behaviors

- ... are a **direct mapping** of sensory inputs to a pattern of motor actions that are then used to achieve a task.
- ... serve as the basic building block for robotics actions, and the overall behavior of the robot is **emergent**.
- ... support good software design principles due to **modularity**.
# Subsumption Architecture

- Introduced by Rodney Brooks ’86.
- Behaviors are networks of sensing and acting modules (augmented finite state machines AFSM).
- Modules are grouped into layers of competence.
- Layers can subsume lower layers.
- No internal state!
Level 0: Avoid

Polar plot of sonars

Sonar → Feel force → Run away → Turn

Collide → Run away → Forward

Polar plot → force

heading

halt

heading encoders
Level 1: Wander

- Sonar
  - Feel force
  - Collide
- Wander
- Avoid
- Run away
- Turn
- Forward

- force
- heading
- modified heading
- polar plot
- halt
- heading encoders
Level 2: Follow Corridor

- **Look** → **Stay in middle**
- **Sonar**
  - **Feel force** → **Run away**
  - **Collide**
- **Integrate**
  - **Forward**
  - **Turn**

- **Wander**
- **Avoid**

- **Polar plot**
  - **Sonar**

- **Distance, direction traveled**
  - **Heading to middle**
  - **Modified heading**
  - **Heading encoders**

- **Fault**
  - **Force**
  - **Force**
  - **Halt**
Potential Field Methodologies

- Treat robot as particle acting under the influence of a potential field
- Robot travels along the derivative of the potential
- Field depends on obstacles, desired travel directions and targets
- Resulting field (vector) is given by the summation of primitive fields
- Strength of field may change with distance to obstacle/target
Primitive Potential Fields

- Uniform
- Perpendicular
- Attractive
- Repulsive
- Tangential
Corridor Following with Potential Fields

- **Level 0** (collision avoidance) is done by the repulsive fields of detected obstacles.

- **Level 1** (wander) adds a uniform field.

- **Level 2** (corridor following) replaces the wander field by three fields (two perpendicular, one uniform).
Characteristics of Potential Fields

- Suffer from **local minima**

- Backtracking
- Random motion to escape local minimum
- Procedural planner s.a. wall following
- Increase potential of visited regions
- Avoid local minima by harmonic functions
Characteristics of Potential Fields

- No preference among layers
- Easy to visualize
- Easy to combine different fields
- High update rates necessary
- Parameter tuning important
Reactive Paradigm

- Representations?
- Good software engineering principles?
- Easy to program?
- Robustness?
- Scalability?
Hybrid Deliberative/Reactive Paradigm

- Combines advantages of previous paradigms
  - World model used for planning
  - Closed loop, reactive control
Discussion

- Imagine you want your robot to perform navigation tasks, which approach would you choose?
- What are the benefits of the behavior based paradigm?
Discussion

- Imagine you want your robot to perform navigation tasks, which approach would you choose?
- What are the benefits of the behavior based paradigm?
- Which approaches will win in the long run?
