Unscented Kalman Filter

Gian Diego Tipaldi, Wolfram Burgard

KF, EKF and UKF

- Kalman filter requires linear models
- EKF linearizes via Taylor expansion

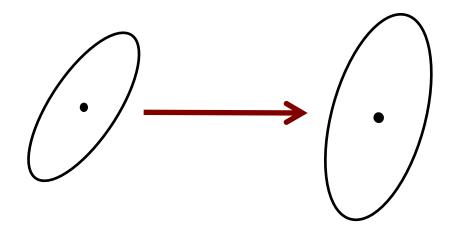

Is there a better way to linearize?

Unscented Transform

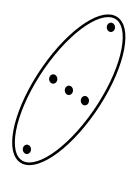

Unscented Kalman Filter (UKF)

Taylor Approximation (EKF)

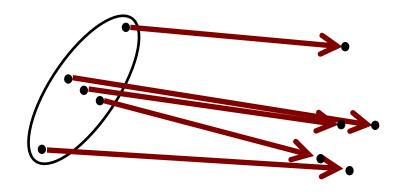

Linearization of the non-linear function through Taylor expansion

Unscented Transform

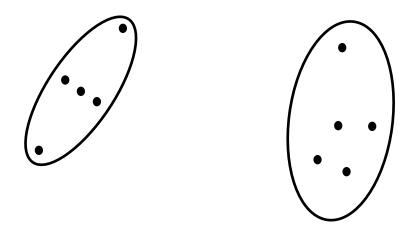

Compute a set of (so-called) sigma points

Unscented Transform

Transform each sigma point through the non-linear function

Unscented Transform

Compute Gaussian from the transformed and weighted sigma points

Unscented Transform Overview

- Compute a set of sigma points
- Each sigma points has a weight
- Transform the point through the nonlinear function
- Compute a Gaussian from weighted points

 Avoids to linearize around the mean as Taylor expansion (and EKF) does

Sigma Points

- How to choose the sigma points?
- How to set the weights?

Sigma Points Properties

- How to choose the sigma points?
- How to set the weights?
- Select $\mathcal{X}^{[i]}, w^{[i]}$ so that:

$$\sum_{i} w^{[i]} = 1$$

$$\mu = \sum_{i} w^{[i]} \mathcal{X}^{[i]}$$

$$\Sigma = \sum_{i} w^{[i]} (\mathcal{X}^{[i]} - \mu) (\mathcal{X}^{[i]} - \mu)^{T}$$

lacktriangle There is no unique solution for $\mathcal{X}^{[i]}, w^{[i]}$

Sigma Points

Choosing the sigma points

$$\mathcal{X}^{[0]} = \mu$$

First sigma point is the mean

Sigma Points

Choosing the sigma points

$$\mathcal{X}^{[0]} = \mu$$

$$\mathcal{X}^{[i]} = \mu + \left(\sqrt{(n+\lambda)\Sigma}\right)_i \quad \text{for } i = 1, \dots, n$$

$$\mathcal{X}^{[i]} = \mu - \left(\sqrt{(n+\lambda)\Sigma}\right)_{i-n} \quad \text{for } i = n+1, \dots, 2n$$
 matrix square root
$$\text{column vector}$$

dimensionality scaling parameter

Matrix Square Root

- Defined as $S \text{ with } \Sigma = SS$
- Computed via diagonalization

$$\Sigma = VDV^{-1}
= V \begin{pmatrix} d_{11} & \dots & 0 \\ 0 & \ddots & 0 \\ 0 & \dots & d_{nn} \end{pmatrix} V^{-1}
= V \begin{pmatrix} \sqrt{d_{11}} & \dots & 0 \\ 0 & \ddots & 0 \\ 0 & \dots & \sqrt{d_{nn}} \end{pmatrix} \begin{pmatrix} \sqrt{d_{11}} & \dots & 0 \\ 0 & \ddots & 0 \\ 0 & \dots & \sqrt{d_{nn}} \end{pmatrix} V^{-1}$$

Matrix Square Root

Thus, we can define

$$S = V \begin{pmatrix} \sqrt{d_{11}} & \dots & 0 \\ 0 & \ddots & 0 \\ 0 & \dots & \sqrt{d_{nn}} \end{pmatrix} V^{-1}$$

$$D^{1/2}$$

so that

$$SS = (VD^{1/2}V^{-1})(VD^{1/2}V^{-1}) = VDV^{-1} = \Sigma$$

Cholesky Matrix Square Root

Alternative definition of the matrix square root

$$L \text{ with } \Sigma = LL^T$$

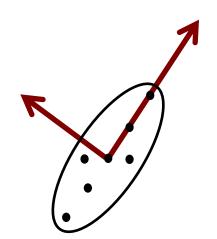

- Result of the Cholesky decomposition
- Numerically stable solution
- Often used in UKF implementations
- ullet L and Σ have the same Eigenvectors

Sigma Points and Eigenvectors

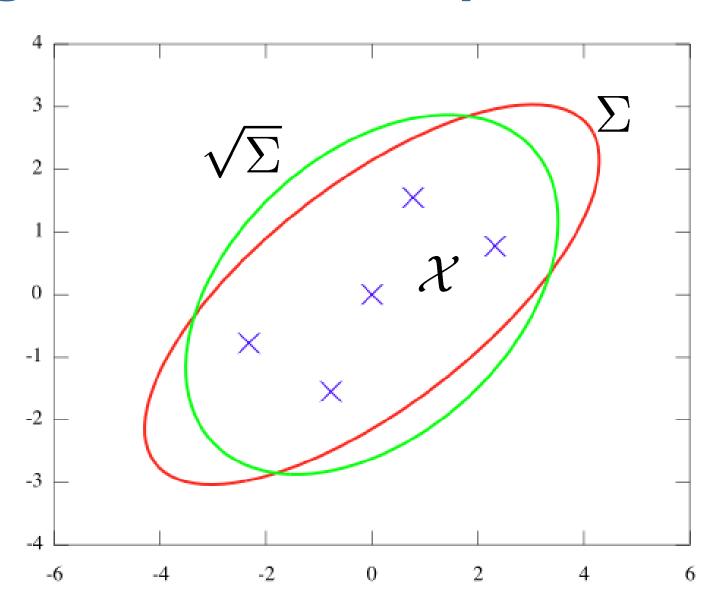

• Sigma point can but do not have to lie on the main axes of Σ

$$\mathcal{X}^{[i]} = \mu + \left(\sqrt{(n+\lambda)} \Sigma\right)_i \quad \text{for } i = 1, \dots, n$$

$$\mathcal{X}^{[i]} = \mu - \left(\sqrt{(n+\lambda)} \Sigma\right)_{i-n} \quad \text{for } i = n+1, \dots, 2n$$

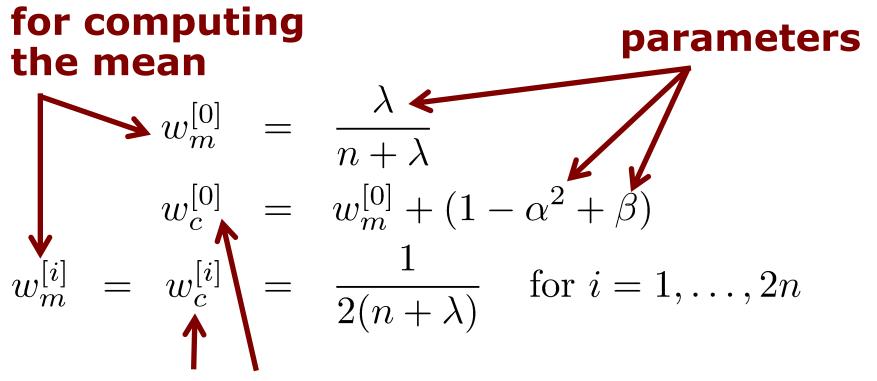

Sigma Points Example

Sigma Point Weights

Weight sigma points

for computing the covariance

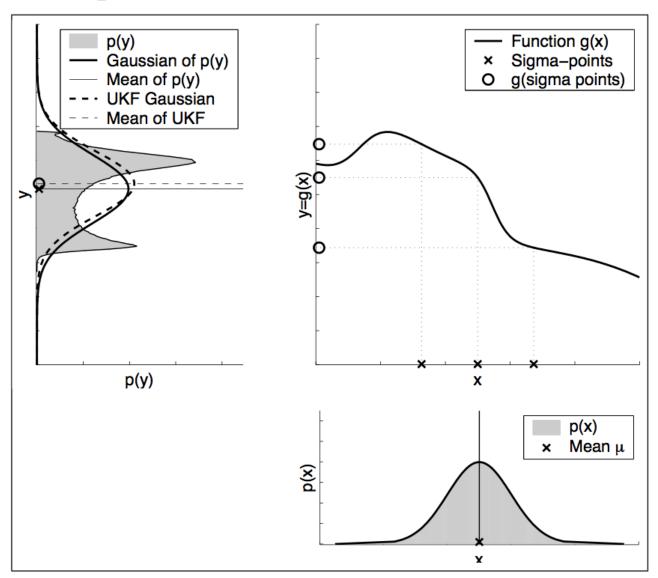

Recover the Gaussian

 Compute Gaussian from weighted and transformed points

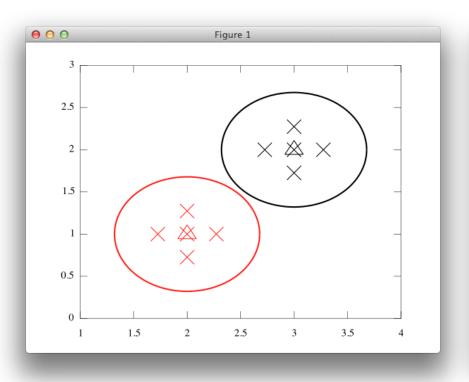

$$\mu' = \sum_{i=0}^{2n} w_m^{[i]} g(\mathcal{X}^{[i]})$$

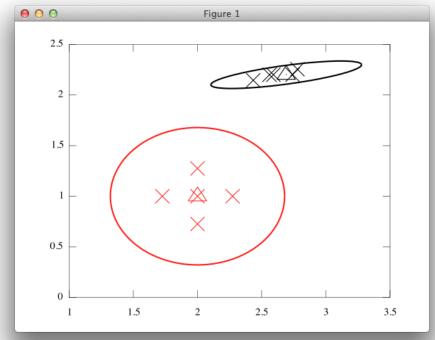

$$\Sigma' = \sum_{i=0}^{2n} w_c^{[i]} (g(\mathcal{X}^{[i]}) - \mu') (g(\mathcal{X}^{[i]}) - \mu')^T$$

Example

Examples

$$g((x,y)^T) = \begin{pmatrix} x+1\\ y+1 \end{pmatrix}^T$$

$$g((x,y)^T) = \begin{pmatrix} 1 + x + \sin(2x) + \cos(y) \\ 2 + 0.2y \end{pmatrix}^T$$

Unscented Transform Summary

Sigma points

$$\mathcal{X}^{[0]} = \mu$$

$$\mathcal{X}^{[i]} = \mu + \left(\sqrt{(n+\lambda)} \Sigma\right)_{i} \quad \text{for } i = 1, \dots, n$$

$$\mathcal{X}^{[i]} = \mu - \left(\sqrt{(n+\lambda)} \Sigma\right)_{i-n} \quad \text{for } i = n+1, \dots, 2n$$

Weights

$$w_m^{[0]} = \frac{\lambda}{n+\lambda}$$

$$w_c^{[0]} = w_m^{[0]} + (1-\alpha^2 + \beta)$$

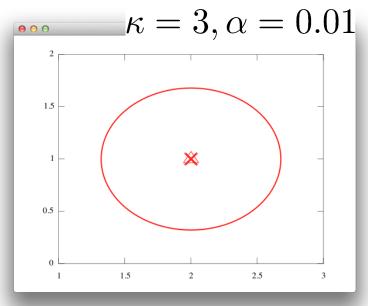

$$w_m^{[i]} = w_c^{[i]} = \frac{1}{2(n+\lambda)} \quad \text{for } i = 1, \dots, 2n$$

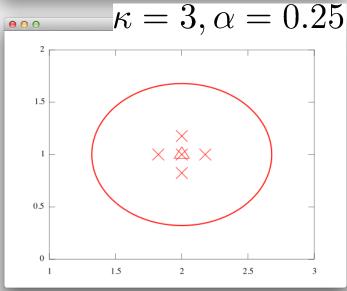

UT Parameters

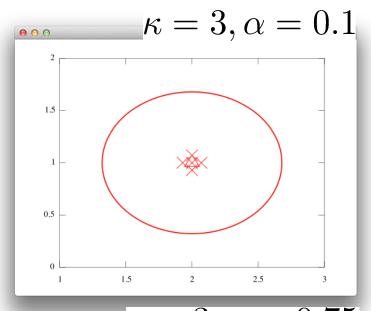

- Free parameters as there is no unique solution
- Scaled Unscented Transform suggests

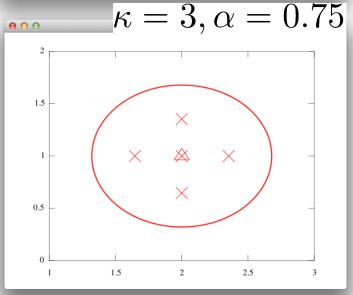

$$\begin{array}{lll} \kappa & \geq & 0 & \text{Influence how far the} \\ \alpha & \in & (0,1] & \text{sigma points are} \\ \alpha & = & \alpha^2(n+\kappa)-n \\ \beta & = & 2 & \text{Optimal choice for} \\ \text{Gaussians} \end{array}$$

UT/UKF Summary

- Unscented transforms as an alternative to linearization
- UT is a better approximation than Taylor expansion
- UT uses sigma point propagation
- Free parameters in UT
- UKF uses the UT in the prediction and correction step

UKF vs. EKF

- Same results as EKF for linear models
- Better approximation than EKF for non-linear models
- Differences often "somewhat small"
- No Jacobians needed for the UKF
- Same complexity class
- Slightly slower than the EKF
- Still restricted to Gaussian distributions

Slide Information

- These slides have been created by Cyrill Stachniss as part of the robot mapping course taught in 2012/13 and 2013/14. I created this set of slides partially extending existing material of Edwin Olson, Pratik Agarwal, and myself.
- I tried to acknowledge all people that contributed image or video material. In case I missed something, please let me know. If you adapt this course material, please make sure you keep the acknowledgements.
- Feel free to use and change the slides. If you use them, I would appreciate an acknowledgement as well. To satisfy my own curiosity, I appreciate a short email notice in case you use the material in your course.
